The durability, strength, low cost, water and chemicals resistance, welding properties, lesser energy, fewer atmosphere emissions and light weight are advantages of plastic bags.

Shalini is confused as she has been reading in the newspaper about the ban on the usage of plastic substances.

She further finds that despite the durability, the use of these materials has presented mankind with serious waste disposal problem as these materials do not disintegrate by themselves. $$k = \frac{2.303}{t} \log \frac{|R|_{x}}{|R|}$$
 where $[R]_{a}$ = initial concentration, $[R]$ = conc. after
time t
When half of the reaction is completed, $[R] = [R]_{x/2}$. Representing, the time
taken for half of the reaction to be completed, by $t_{1/2}$, equation becomes:

$$k = \frac{2.303}{t_{1/2}} \log \frac{|R|_{x}}{|R|_{x}/2}$$

$$l_{1/2} = \frac{2.303}{k} \log 2$$

$$t_{1/2} = \frac{2.303}{k} \log 2$$

$$t_{1/2} = \frac{2.303}{k} \times 0.3010$$

$$t_{1/2} = \frac{0.693}{k}$$
The above equation shows that half life first order reaction is independent of
the initial concentration of the reactant.
(b) For a first order reaction

$$t_{99%_{k}} = \frac{2.303}{k} \log \frac{a}{a-0.99a}$$

$$t_{90\%_{k}} = \frac{2.303}{k} \log \frac{a}{a-0.99a}$$

$$t_{90\%_{k}} = \frac{2.303}{k} \log \frac{a}{a-0.99a}$$

$$t_{90\%_{k}} = \frac{2.233}{k} \log \frac{a}{a-0.99a}$$

$$t_{90\%_{k}} = \frac{2.33}{k} \log \frac{a}{k} = 2$$

$$t_{90\%_{k}} = \frac{2.33}{k} \log \frac{a}{k} = 2$$

$$t_{90\%_{k}} = \frac{2.433}{k} \log \frac{a}{k} = 2$$
